

SUBMISSION REQUIREMENT 4

Relevant Experience

Capability summary for the type of system being proposed, focused on secure workflow delivery, role segregation, and document-heavy applicant processing.

Document Type	Experience and delivery positioning
----------------------	-------------------------------------

Document Date	4 May 2026
----------------------	------------

Note	Insert named client references before final external submission if available
-------------	--

This document is intentionally factual. It highlights relevant delivery patterns without inventing client references or case studies that are not yet supplied.

DELIVERY FIT

1. Closely Related System Types

The proposed application system sits at the intersection of several familiar enterprise workflow patterns. The strongest comparable categories are:

Admissions and Scholarship Portals
Applicant intake, document collection, shortlist ranking, and deadline-driven review cycles.

Recruitment and Screening Platforms
Multi-stage evaluator workflows, interview scoring, and final decision panels.

Grant and Committee Review Systems
Reviewer separation, structured scoring, comparative dashboards, and audit-heavy decision records.

Compliance-Sensitive Internal Tools
Role-based access, encryption, deletion rights, monitoring, and incident response requirements.

2. Why This Experience Transfers Well

Required Capability	Relevant Delivery Pattern
Multi-role workflow gating	Admissions, grant review, and hiring systems all rely on ordered state transitions and reviewer isolation.
Comparative scorecard logic	Ranking and score aggregation are standard patterns in scholarship, recruitment, and evaluation platforms.
Document-heavy applicant records	Secure upload, storage, checklist verification, and ZIP bundling are common in formal submission systems.
POPIA-aligned controls	Audit logging, data export, deletion, and strict access boundaries map directly to regulated information systems.

PROPOSAL POSITIONING

3. Reference-Ready Positioning

For proposal purposes, the strongest truthful positioning is to emphasize experience with the **patterns** that matter most to this system:

- role-segregated dashboards where each reviewer sees only the fields required for their task
- workflow-driven applications where later actions are blocked until prerequisite stages are completed
- audit-sensitive platforms where every important change must be attributable to a user and timestamp
- document and evidence management flows with export, retention, and controlled download requirements
- secure public-facing forms that feed into internal operational decision making

4. Suggested Final Submission Additions

If actual client references are available, the final external version of this PDF should add:

- one named or anonymized admissions / recruitment case study
- one secure document workflow case study
- one reference that speaks to delivery reliability, not only technical skill
- one short note on post-handover support or operational continuity

If no formal references are available, it is safer to submit a strong capability summary than to overstate direct prior delivery. For a proposal pack, credibility is more valuable than inflated claims.

5. Closing Position

The proposal is technically strongest when it presents this system as a secure admissions-style workflow platform with reviewer separation, comparative scoring, and POPIA-aligned controls. That positioning is precise, commercially credible, and closely matched to the confirmed process.
